

P-SHOT® FOR MEN

P-SHOT PLATELET RICH PLASMA PENIS ENHANCEMENT

It's estimated that 1 in 2 men over the age of 40 experience some level of sexual performance decline. The P-Shot is a new procedure which can improve sexual function in men.

The P-Shot is based on the procedure known as Platelet-Rich Plasma (PrP). PrP has been around for roughly 10 years. It is proven safe and effective by many for its use in injury repair in professional athletes and others.

The P-Shot is drug and surgery free. It takes approximately 30 minutes to complete the procedure. Benefits are usually observed within 4-7 days following the procedure.

PrP is a process of taking your own blood, extracting the platelet-rich plasma from the blood, then injecting the plasma into the key areas of the penis.

The goal of the P-Shot is to improve vascular function and nerve sensitivity in the penis. This can result in better erections and improved sensitivity.

PrP works by the natural human growth factors taken from your own blood. These growth factors are then reintroduced into the target area. The growth factors stimulate collagen growth and cell rejuvenation.

We use one of the best PrP machines. The PrP process we use was recently shown to beat out 12 other commonly used machines used for PrP. The machine can deliver as much as two times the growth factors as others.
